

# Facing ERP Migration?

## Top 3 Reasons to Modernize Entitlement Dependencies Now

If you manage entitlements using your ERP, you have to revalidate every entitlement when you upgrade, since you embed complex entitlement logic through custom code. Your IT team is burdened with extra, avoidable, tasks, and your products are slower to market.

ERP migration is the perfect chance to alleviate this problem. Since you're already modernizing core systems, you can move entitlements into a dedicated platform now instead of rebuilding old entitlement logic in the new ERP.

## Improve IT with a Dedicated, Modern Entitlement Management System

By separating entitlement management from your ERP, you gain three core operational benefits for your IT team.

### PROBLEM

### SOLUTION

1	<b>Remove Entitlement Reworks</b>	Hard-coded entitlements require rebuilding custom logic and repeating testing during every ERP upgrade.	Use a standalone entitlement system as the source of truth. ERP connects through APIs while access rules are managed outside the ERP.
2	<b>Reduce Upgrade Risk</b>	ERP-embedded entitlement logic increases attack surface and makes access controls difficult to audit.	Centralize entitlements to standardize policies, strengthen governance, and provide clear audit trails.
3	<b>Lower IT Costs</b>	Custom entitlement code necessitates extra maintenance, complex upgrades, and operational overhead.	Decouple entitlements to eliminate custom code, streamline upgrades, and automate provisioning.

Explore the advantages of a dedicated entitlement management system.
