

# Thales Application Security

DATASHEET

THALES

CYBERSECURITY

## Protection that keeps businesses running continuously

In today's modern application landscape, maintaining critical applications, APIs, and their data has never been more essential. As organizations increasingly rely on these assets to fuel their expansion, they play a pivotal role in reaching customers around the world and shaping business models. These applications require protection from security threats, yet end-users demand high availability and an uninterrupted experience, which can make for a tough balancing act. To meet this need, Thales Application Security empowers organizations to protect their applications and mitigate risk while providing an optimal user experience. Thales also makes vendor consolidation and management simplicity a reality, with application security components offered as part of an integrated solution set.

## Secure your critical applications

Thales deploys an integrated defense-in-depth model which provides a layered approach to enforcing security from the application to the end user. Through Thales **Runtime Application Self-Protection (RASP)**, a lightweight agent is incorporated during the software development cycle. An analyst leader in reports like Gartner® Magic Quadrant™, Thales provides **Web Application Firewalls (WAF)** solutions (cloud-based Cloud WAF and on-premises or virtual appliance WAF Gateway) to defend against all OWASP Top 10 threats including SQL injection, cross-site scripting, illegal resource access, and remote file inclusion. Inspection and enforcement of user traffic occurs across Thales' global network of PoPs, each also a DDoS scrubbing center. Policies and signatures are kept up-to-date for your WAF and **API Security** based on live, crowdsourced intelligence and from security experts at Thales Research Labs. Thales API Security provides continuous protection of all APIs using deep discovery and classification to detect all public, private and shadow APIs. It also protects against business logic attacks and many more of the OWASP API Top Ten. The easy-to-deploy solution empowers security teams to implement a positive API security model.

### KEY CAPABILITIES DISCOVERY

Uncover and act upon key

critical security incidents by utilizing artificial intelligence

and machine learning.

Secure out-of-the-box against OWASP Top 10 threats across

both the cloud and on-premises

WAF deployments.

Prevent data theft from

client-side attacks and other online skimming techniques to

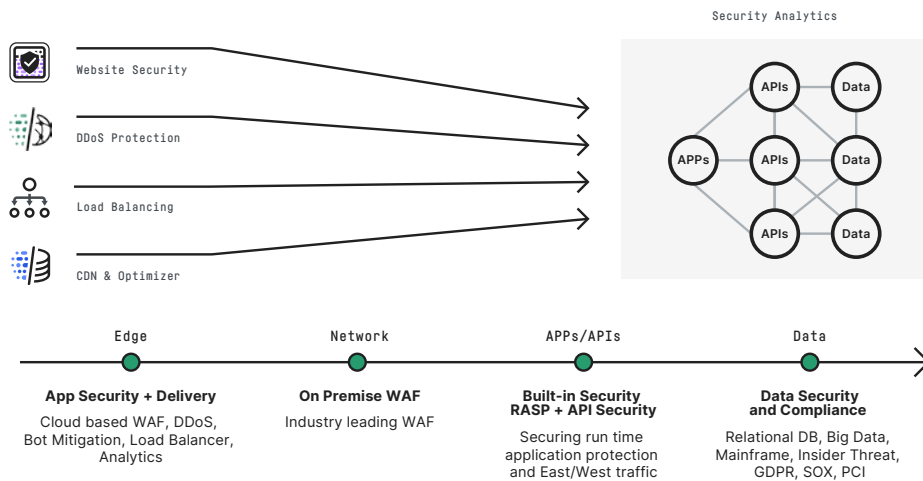

maintain compliance.

Mitigate all bot-driven account takeover attacks and prevent account based fraud.

Support faster application release cycles while ensuring application protection during runtime.

Ensure high availability even when under attack from malicious bots and DDoS.

## Thales Security Defense-in-Depth Architecture

## Act on critical insights with machine learning

With today's complex and ever-changing threat landscape, it's more important than ever to gain visibility across your data and applications. An explosion of security alerts can keep organizations from discovering critical attacks that actually pose an imminent threat. **Attack Analytics**, a key part of Thales Application Security, combats alert fatigue by distilling millions of security alerts into a prioritized set of security insights. It gives recommended actions to improve your security posture, helping you recognize your cyber risk and help bring it down.

## Avoid disruption to your business

Cybercriminals often wage disruption campaigns against high-profile targets like bank, retail or political organizations. They are driven by revenge, blackmail or political activism and utilize vast botnet networks to wage devastating attacks. Organizations without proper protection from malicious bots and Distributed Denial of Service (DDoS) attack are exposed to the risk of users experiencing slowed or denied access to their websites. Constant attack campaigns can drive users from returning, fulfilling the goal of the attacker. Thales Application Security provides powerful **DDoS Protection** and **Advanced Bot Protection** to eliminate attacks long before malicious traffic even has a chance to reach a customer's website. Multiple DDoS protection services are available, with always-on protection for websites, DNS servers, and individual IPs, and always-on or on-demand protection for networks. With near-zero latency and backed by a 3-second service level agreement for network protection, DDoS traffic is mitigated without disruption to legitimate traffic. And with Thales Advanced Bot Protection, fingerprinting and client classification categorizes whether traffic is coming from a human, a good bot or a bad bot. It does so quickly and accurately, with a very low false positive rate, protecting websites, mobile apps and APIs against all OWASP 21 automated threats, including account takeover, web scraping, business logic abuse and fraud.

## Ensure a seamless user experience

Organizations that depend upon return users often require designing their website infrastructure so that web content may be quickly delivered to meet global user demand at anytime. Thales Application Delivery with its **Content Delivery Network (CDN)** optimizes website delivery by providing content closest to the end-user. With a global network of PoPs, Thales is able to provide quick and reliable access to web content. An application-aware CDN dynamically profiles a website, identifying all cacheable content (dynamic and static), and provides dynamic content acceleration. Profiling and frequency analysis ensure the most frequently accessed resources are detected and served directly from memory, allowing website optimization, improved performance, and lowered bandwidth costs.

## Protect sensitive customer data and ensure compliance

**Client-side protection** further helps organizations secure every aspect of their web applications and ensure the safety and privacy of their customers' data. It mitigates the risk of client-side attacks that exfiltrate sensitive data, resulting in devastating, costly data breaches. By providing clear visibility with actionable insights and easy controls, Thales empowers your security team to effortlessly determine the nature of each service and block any unapproved ones. This enables your organization to meet data security and privacy compliance standards, including those set in the latest version of PCI DSS.

## Consolidated Protection, Powerful Packaging

**AppProtect** is a flexible and comprehensive approach to securing applications. A single license offers you the ability to deploy Thales Application Security how and when you need it. FlexProtect for Applications allows customers the flexibility to adapt their security without regard to infrastructure. You're protected regardless of the number, location or type of devices or services used. FlexProtect helps you protect apps wherever you deploy them - in the cloud, or on-premises or as a hybrid model.

## Thales APPLICATION SECURITY

Client-side Protection is a key component of Thales' Web Application & API Protection (WAAP), which reduces risk while providing an optimal user experience. Our solutions safeguard applications on-premises and in the cloud with:

Web application firewall (WAF)

API Security

Distributed Denial of Service (DDoS) protection

Advanced Bot Protection

Account Takeover Protection

Runtime Application Self Protection (RASP)

Actionable security insights

Security-enabled application delivery

**Thales is the cybersecurity leader that helps organizations protect critical applications, APIs, and data, anywhere, at scale, and with the highest ROI.**
